ABSTRACT

A transient three-dimensional heat conduction code was developed using finite differences. A stability restriction on the time step was avoided using a technique proposed by Brian. Computations from the code were validated using both the explicit technique and an available closed-form solution for small times. The maximum error was found to be within 0.019 percent for an 11 x 11 x 11 grid and time step of 17.117 seconds. The total CPU time to carry out the computations up to 3,600 seconds using Brian's technique was six times that required for the explicit technique with the same time step of 17.117 seconds. However, as the time step was increased without altering the geometry, the CPU time using Brian's technique decreased and was less than that used in the explicit technique for time steps larger than 110 seconds. The validated code was also used in the analysis of the transient thermal response of a component on an orbiting spacecraft.

ACKNOWLEDGMENTS

The author would like to express his deep gratitude to Assistant Professor Y. Joshi, his thesis advisor, for his guidance and advice in the endeavor.

I. INTRODUCTION

A. STATEMENT OF PROBLEM

Three-dimensional transient heat conduction computations involving finite difference techniques can be costly and time consuming. In the explicit technique, there is a maximum time increment that can be used before the solution becomes unstable [Ref. 1]. This time increment results from an upper limit on the allowable values of the Fourier number [Ref. 2]. The implicit technique, on the other hand, requires more complicated computations than the explicit technique due to matrix inversion operations [Ref. 2]. Even the storage capability of a modern computer can be taxed when dealing with storage and manipulation of very large matrices [Ref. 3]. Both the explicit and implicit techniques can become expensive when a large number of nodes is required [Ref. 4].

For two-dimensional transients, an alternative technique is the alternating direction implicit (ADI) method. Calculations at each time step require only the handling of tridiagonal matrices [Ref. 5]. A direct extension of the ADI technique to three-dimensional problems, however, has been found to have only conditional stability [Ref. 5]. A different algorithm by Brian is unconditionally stable and still requires the handling of only tridiagonal system of equations, thus avoiding the more complex matrix manipulation of the implicit approach [Ref. 3].

B. OBJECTIVES

The objectives of this study were:

1. To develop a FORTRAN computer program employing Brian's technique for three-dimensional transient heat conduction.
2. To validate the FORTRAN computer program using the explicit technique with identical geometric configuration, boundary, and initial conditions. Comparisons with closed-form solutions available for a semi-infinite geometry were also made.
3. To employ the above technique in the application of temperature computations involving an orbiting satellite.

This study was also intended to be a basis for future satellite heat transfer analysis and computations involved with Project Orion, the Naval Postgraduate School's multi-disciplinary space research program.

All objectives were achieved.

II. DEVELOPMENT OF MODEL

A. MODEL CONDITIONS

The model is a three-dimensional rectangular block with geometric dimensions expressed in Cartesian coordinates. A numerical temperature solution only permits the determination of the temperature distribution at discrete points or nodes [Ref. 2]. The method of finite differences requires that a nodal equation be written for each node in the block. The number of nodes in any coordinate direction is based on the distance increment in the same direction.

The nodal temperature equation for each node was obtained using a conservation of energy equation within a control volume. Incropera and DeWitt [Ref. 2] present the general form of the conservation of energy equation as

$$\dot{E}_{IN} - \dot{E}_{OUT} + \dot{E}_{GEN} = \dot{E}_{ST} \quad (1)$$

The nodal temperature equations were developed using equation 1. In the following sections, an equation for a node on the left surface of the rectangular block away from corners and edges is derived for both the explicit and Brian techniques. Equations for all other nodes are derived in an identical fashion. The explicit technique equations are tabulated in Appendix A and the Brian technique equations are tabulated in Appendix B.

B. EXPLICIT TECHNIQUE

1. Derivation of Nodal Temperature Equations

Figure 1 shows the left surface of the rectangular block with associated boundary conditions. Equation 1 is rewritten assuming that all the energy components are into the control volume as

$$\dot{E}_{IN} + \dot{E}_{GEN} = \dot{E}_{ST} \quad (2)$$

where the energy generation term is assumed to be zero.

Using finite difference notation, the energy storage term is

$$\dot{E}_{ST} = \rho C \Delta x \frac{\Delta y}{2} \Delta z \left(\frac{T_{i,j,k}^{n+1} - T_{i,j,k}^n}{\Delta t} \right) \quad (3)$$

The energy inflow term, \dot{E}_{IN} , is, in general, composed of convection, conduction, radiation, and imposed heat flux terms. For the development of the explicit technique, the radiation term was neglected. In the explicit technique, all involved nodal temperatures on the left side of equation 2 are evaluated at the prior time step. The convection term is thus

$$\dot{E}_{CONV} = h \Delta x \Delta z (T_{\infty} - T_{i,j,k}^n) \quad (4)$$

Figure 1. **Left Surface of Rectangular Block Used in the Model**

The net conduction term will have contributions from all three coordinate directions and is

$$\begin{aligned} \dot{E}_{\text{COND}} = & k \frac{\Delta y}{2} \Delta z \frac{T_{i-1,j,k}^n + T_{i+1,j,k}^n - 2T_{i,j,k}^n}{\Delta x} + k \Delta x \Delta z \frac{T_{i,j,k+1}^n - T_{i,j,k}^n}{\Delta y} \\ & + k \Delta x \frac{\Delta y}{2} \frac{T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n}{\Delta z} \end{aligned} \quad (5)$$

The flux term will be

$$\dot{E}_{\text{FLUX}} = q'' \Delta x \Delta z \quad (6)$$

Substituting equations 3 through 6 into equation 2 produces

$$\begin{aligned}
& k \frac{\Delta y}{2} \Delta z \frac{T_{i-1,j,k}^n + T_{i+1,j,k}^n - 2T_{i,j,k}^n}{\Delta x} + k \Delta x \Delta z \frac{T_{i,j+1,k}^n - T_{i,j,k}^n}{\Delta y} \\
& + k \Delta x \frac{\Delta y}{2} \frac{T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n}{\Delta z} + k \Delta x z (T_{\infty} - T_{i,j,k}^n) \\
& + q'' \Delta x z = \rho C \Delta x \frac{\Delta y}{2} \Delta z \left(\frac{T_{i,j,k}^{n+1} - T_{i,j,k}^n}{\Delta t} \right)
\end{aligned} \tag{7}$$

The temperature at the next time level, $n+1$, is next expressed in terms of temperatures at the previous time level, n . To accomplish this, terms in equation 7 are rearranged.

Multiplying each term in equation 7 by $\frac{\Delta x}{k \Delta y \Delta z}$ yields

$$\begin{aligned}
& \frac{1}{2} (T_{i-1,j,k}^n + T_{i+1,j,k}^n - 2T_{i,j,k}^n) + \left(\frac{\Delta x}{\Delta y} \right)^2 (T_{i,j+1,k}^n - T_{i,j,k}^n) \\
& + \frac{1}{2} \left(\frac{\Delta x}{\Delta z} \right)^2 (T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) \\
& + \frac{h}{k} \Delta x \frac{\Delta x}{\Delta y} (T_{\infty} - T_{i,j,k}^n) + q'' \frac{\Delta x^2}{k \Delta y} = \frac{1}{2} \frac{\rho C}{k \Delta t} \Delta x^2 (T_{i,j,k}^{n+1} - T_{i,j,k}^n)
\end{aligned} \tag{8}$$

Equation 8 is simplified using Biot and Fourier numbers, which are written as $\frac{h}{k} \Delta x$ and $\frac{k \Delta t}{\rho C \Delta x^2}$, respectively. The terms $\left(\frac{\Delta x}{\Delta y} \right)^2$, $\left(\frac{\Delta x}{\Delta z} \right)^2$, and $\left(\frac{\Delta x}{\Delta y} \right)^2$ are identified as R_1 , R_2 , and $R_1^{\frac{1}{2}}$, respectively. Equation 8 now becomes

$$\begin{aligned}
& \frac{1}{2} (T_{i-1,j,k}^n + T_{i+1,j,k}^n - 2T_{i,j,k}^n) + R_1 (T_{i,j+1,k}^n - T_{i,j,k}^n) \\
& + \frac{1}{2} R_2^2 (T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) \\
& + Bi R_1^{\frac{1}{2}} (T_{\infty} - T_{i,j,k}^n) + q'' R_1 \frac{\Delta y}{k} = \frac{1}{2Fo} (T_{i,j,k}^{n+1} - T_{i,j,k}^n)
\end{aligned} \tag{9}$$

Rearranging terms, the temperature at the current time level is expressed as

$$\begin{aligned}
T_{i,j,k}^{n+1} = & T_{i,j,k}^n + Fo (T_{i-1,j,k}^n + T_{i+1,j,k}^n - 2T_{i,j,k}^n) + 2Fo R_1 (T_{i,j+1,k}^n - T_{i,j,k}^n) \\
& + 2Fo R_2^2 (T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) \\
& + 2Fo Bi R_1^{\frac{1}{2}} (T_{\infty} - T_{i,j,k}^n) + 2Fo R_1 q'' \frac{\Delta y}{k}
\end{aligned} \tag{10}$$

In a similar manner, the temperature equations for each node are derived.

2. Restrictions on Time Step in the Explicit Technique

In the derivation of the explicit technique equations, the Fourier number was expressed as

$$Fo = \frac{k\Delta t}{\rho C \Delta x^2} \tag{11}$$

The stability of the temperature solution is dependent on the time increment [Ref. 2]. Rearranging equation 10 to isolate the node of interest at both the current and previous time levels yields

$$\begin{aligned}
T_{i,j,k}^{n+1} = & Fo(T_{i-1,j,k}^n + T_{i+1,j,k}^n) + 2FoR_1 T_{i,j+1,k}^n + FoR_2(T_{i,j,k-1}^n + T_{i,j,k+1}^n) \\
& + 2FoB_1 R_1^{\frac{1}{2}} T_{i,j,k}^n + 2FoR_1 q'' \frac{\Delta y}{k} \\
& + (1 - 2Fo - 2FoR_1 - 2FoR_2 - 2FoBiR_1^{\frac{1}{2}}) T_{i,j,k}^n
\end{aligned} \tag{12}$$

The coefficient associated with the previous time level at the node of interest must be greater than or equal to zero [Ref. 2]. This implies

$$1 - 2Fo(1 + R_1 + R_2 + BiR_1^{\frac{1}{2}}) \geq 0 \tag{13}$$

Rearranging terms, it follow that, for stability,

$$Fo \leq \frac{1}{2(1 + R_1 + R_2 + BiR_1^{\frac{1}{2}})} \tag{14}$$

Limitations on Fo were derived for each different node. The maximum allowable Fo was chosen as the least of all these values. Since the Fourier number is dependent on Δt , Δx , and material properties, it follows from equation 11 that the maximum time increment will be dependent on the distance increment. As Δx decreases, the maximum time increment must also decrease to have equation 14 hold true [Ref. 1].

3. Numerical Calculations

A computer program (program EXPLICIT) was written to evaluate the transient temperature distribution within the block using the explicit technique. Figure 2 is a flow-chart description of the program. A complete listing of program EXPLICIT is provided in Appendix C.

C. BRIAN'S TECHNIQUE

The Brian technique provides unconditional stability, allowing large time increments for transient three-dimensional computations [Ref. 3]. As mentioned earlier, the explicit and fully implicit techniques may become unsuitable for computations involving a large number of nodes or long transient times. The explicit technique relies on small time increments for stability, thus increasing the amount of computer time required for calculations [Ref. 5]. The implicit technique requires inverting large matrices that may create problems with storage capability and computer time [Ref. 4].

Another possible technique, the alternating direction implicit (ADI), is applicable to both two- and three-dimensional problems. While the ADI method is unconditionally stable for two-dimensional cases, instability occurs for large time increments in three-dimensional problems [Refs. 4, 5].

The Brian technique modifies the ADI method to provide unconditional stability and minimize computer time [Ref. 3].

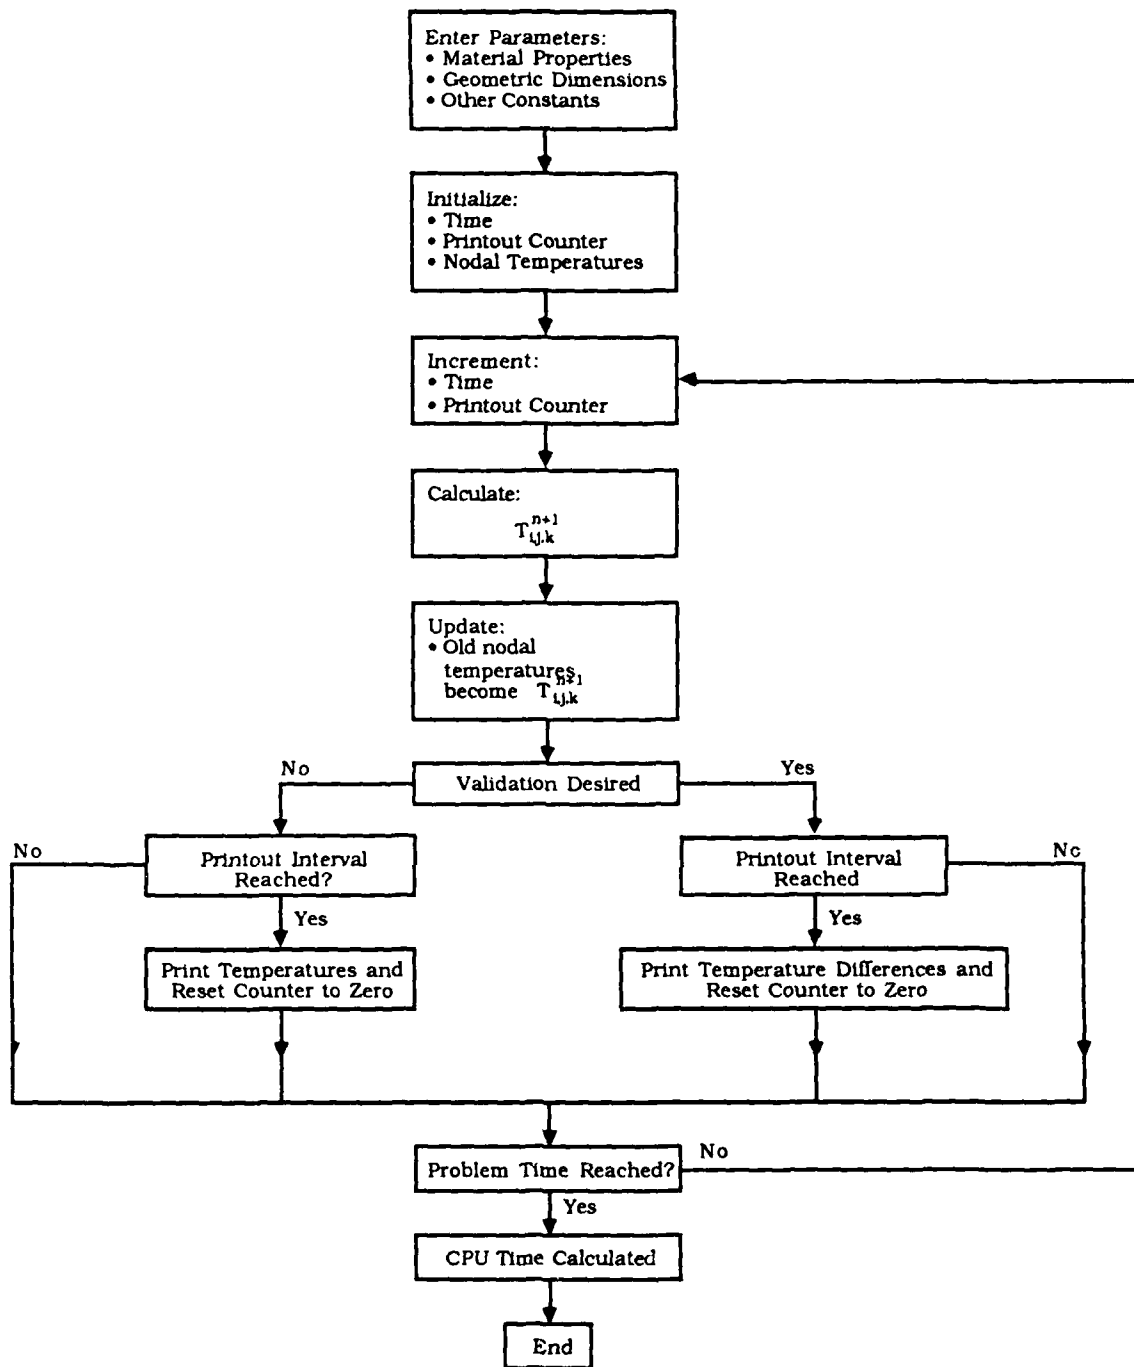

Figure 2. Flow Chart for Program EXPLICIT

1. Derivation of Nodal Temperature Equations

Figure 1 shows the left surface of the rectangular block with associated boundary conditions. Equation 2 is again the starting point for nodal temperature equation derivation and is

$$\dot{E}_{IN} + \dot{E}_{GEN} = \dot{E}_{ST} \quad (2)$$

where the energy generation term is again assumed to be zero.

The nodal temperature equation derivation for Brian's technique uses half-time steps for each coordinate direction. This differs from the explicit technique, in which a whole-time increment is used and spatial coordinate direction is not considered.

In Brian's technique, the first half-time level, $n + \frac{1}{2}$, treats temperatures in the x direction as unknown with temperatures in the y and z directions known from the previous time level, n. Solving a tridiagonal system of simultaneous equations, the temperatures at the $n + \frac{1}{2}$ level are determined.

Temperatures in the y direction are then determined using x-direction temperatures at the $n + \frac{1}{2}$ time level and z-direction temperatures at the M time level. Similarly, temperatures in the z-direction at the current $n+1$ time level are determined using $n + \frac{1}{2}$ temperatures from the x and y directions.

The above procedure is demonstrated for a node on the left surface away from corners and edges.

The energy storage term is

$$\dot{E}_{ST} = \rho C \Delta x \frac{\Delta y}{2} \Delta z \left(\frac{T_{i,j,k}^{n+\frac{1}{2}} - T_{i,j,k}^n}{\frac{\Delta t}{2}} \right) \quad (15)$$

The energy inflow term, \dot{E}_{IN} , is composed of convection, conduction, radiation, and any imposed external heat fluxes. As a first step, only the nodal temperatures associated with heat conduction and energy storage in the x-direction are evaluated at the $n + \frac{1}{2}$ time level. The convection term is thus

$$\dot{E}_{CONV} = h \Delta x \Delta z (T_{\infty} - T_{i,j,k}^n) \quad (16)$$

The net conduction term will have contributions from all three coordinate directions and is

$$\begin{aligned} \dot{E}_{COND} = & k \frac{\Delta y}{2} \Delta z \frac{T_{i-1,j,k}^{n+\frac{1}{2}} + T_{i+1,j,k}^{n+\frac{1}{2}} - 2T_{i,j,k}^{n+\frac{1}{2}}}{\Delta x} + k \Delta x \Delta z \frac{T_{i,j,k+1}^n - T_{i,j,k}^n}{\Delta x} \\ & + k \Delta x \frac{\Delta y}{2} \frac{T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n}{\Delta z} \end{aligned} \quad (17)$$

The radiation term, assuming extensive surroundings, will be

$$\dot{E}_{RAD} = \sigma \epsilon \Delta x \Delta z (T_{\infty}^4 - T_{i,j,k}^{n4}) \quad (18)$$

For applications involving an orbiting spacecraft, additional input flux terms need to be considered. These include the solar flux, the infrared emission from the earth, and the reflected component of the

solar flux from the earth's atmosphere, the albedo. The solar flux term will be

$$\dot{E}_{\text{SOLAR}} = \Delta x \Delta z \alpha C_{\text{SA}} \phi_s \quad (19)$$

The reflected solar flux (albedo) term will be

$$\dot{E}_{\text{ALBEDO}} = \Delta x \Delta z F_A \alpha a \phi_s \quad (20)$$

The earth flux term will be

$$\dot{E}_{\text{EARTH}} = \Delta x \Delta z F_E \epsilon \phi_E \quad (21)$$

The imposed heat flux term will be

$$\dot{E}_{\text{FLUX}} = \Delta x \Delta z q'' \quad (22)$$

Substituting equations (15) through (22) into equation 2 yields

$$\begin{aligned} & k \frac{\Delta y}{2} \Delta z \frac{T_{i-1,j,k}^{n+\frac{1}{2}} + T_{i+1,j,k}^{n+\frac{1}{2}} - 2T_{i,j,k}^{n+\frac{1}{2}}}{\Delta x} + k \Delta x \Delta z \frac{T_{i,j+1,k}^n - T_{i,j,k}^n}{\Delta y} \\ & + k \Delta x \frac{\Delta y}{2} \frac{T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n}{\Delta z} + \sigma \epsilon \Delta x \Delta z (T_{-}^4 - T_{i,j,k}^{n*}) \\ & + \Delta x \Delta z \alpha C_{\text{SA}} \phi_s + \Delta x \Delta z F_A \alpha a \phi_s + \Delta x \Delta z F_E \epsilon \phi_E + \Delta x \Delta z q'' \\ & + h \Delta x \Delta z (T_{-} - T_{i,j,k}^n) = \rho C \Delta x \frac{\Delta y}{2} \Delta z \frac{T_{i,j,k}^{n+\frac{1}{2}} - T_{i,j,k}^n}{\frac{\Delta t}{2}} \end{aligned} \quad (23)$$

The temperatures at time level $n + \frac{1}{2}$ are next expressed in terms of temperatures at the previous time level, n . To accomplish this, terms in equation 23 are rearranged.

Multiplying each term in equation 23 by $\frac{\Delta x}{k\Delta y\Delta z}$ yields

$$\begin{aligned}
 & \frac{1}{2} \left(T_{i-1,j,k}^{n+\frac{1}{2}} + T_{i+1,j,k}^{n+\frac{1}{2}} - 2T_{i,j,k}^{n+\frac{1}{2}} \right) + \left(\frac{\Delta x}{\Delta y} \right)^2 (T_{i,j+1,k}^n - T_{i,j,k}^n) \\
 & + \frac{1}{2} \left(\frac{\Delta x}{\Delta z} \right)^2 (T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) + \frac{\sigma \epsilon \Delta x^2}{k\Delta y} (T_{-}^4 - T_{i,j,k}^4) \\
 & + \frac{\alpha C_{sa} \Delta x^2}{k\Delta y} \phi_s + \frac{\alpha F_A a \Delta x^2}{k\Delta y} \phi_s + \frac{F_E \epsilon \Delta x^2}{k\Delta y} \phi_E + \frac{\Delta x^2}{k\Delta y} q'' \\
 & + \frac{h \Delta x^2}{k\Delta y} q'' + \frac{h \Delta x^2}{k\Delta y} (T_{-} - T_{i,j,k}^n) = \frac{2\rho C \Delta x^2}{2k\Delta t} (T_{i,j,k}^{n+\frac{1}{2}} - T_{i,j,k}^n)
 \end{aligned} \tag{24}$$

Equation 24 is simplified using Biot and Fourier numbers, which are written as $\frac{h}{k} \Delta x$ and $\frac{k\Delta t}{2\rho C \Delta x^2}$, respectively. Equation 24 now becomes

$$\begin{aligned}
 & \frac{1}{2} \left(T_{i-1,j,k}^{n+\frac{1}{2}} + T_{i+1,j,k}^{n+\frac{1}{2}} - 2T_{i,j,k}^{n+\frac{1}{2}} \right) + R_1 (T_{i,j+1,k}^n - T_{i,j,k}^n) \\
 & + \frac{1}{2} R_2 (T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) + \frac{\sigma \epsilon}{k} R_1 \Delta y (T_{-}^4 - T_{i,j,k}^4) \\
 & + \frac{\alpha C_{sa} R_1 \Delta y}{k} \phi_s + \frac{\alpha F_A a R_1 \Delta y}{k} \phi_s + \frac{F_E \epsilon R_1 \Delta y}{k} \phi_E \\
 & + \frac{R_1 \Delta y}{k} q'' + B_1 R_1^{\frac{1}{2}} (T_{-} - T_{i,j,k}^n) = \frac{1}{2Fo} (T_{i,j,k}^{n+\frac{1}{2}} - T_{i,j,k}^n)
 \end{aligned} \tag{25}$$

Rearranging terms, the temperatures at the first half-time step level in the x direction are

$$\begin{aligned}
& -FoT_{i-1,j,k}^{n+\frac{1}{2}} + (1 + 2Fo)T_{i,j,k}^{n+\frac{1}{2}} - FoT_{i,j,k}^{n+\frac{1}{2}} = T_{i,j+1,k}^n \\
& + 2FoR_1(T_{i,j+1,k}^n - T_{i,j,k}^n) + FoR_2(T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) \\
& + 2FoR_1\frac{\alpha C_{SA}}{k}\phi_s + 2FoR_1\Delta y\frac{\alpha F_A a}{k}\phi_s + 2FoR_1\Delta y\frac{F_E \epsilon}{k}\phi_E \quad (26) \\
& + 2FoR_1\Delta y + \frac{q''}{k} + 2FoBiR_1^{\frac{1}{2}}(T_\infty - T_{i,j,k}^n)
\end{aligned}$$

The next step is to express the temperatures in the y-direction at time level $n + \frac{1}{2}$ using x-direction temperatures determined at time level $n + \frac{1}{2}$ from equation 26 and z-direction temperatures at time level n . For greater clarity, the x-direction temperatures at time level $n + \frac{1}{2}$, $T^{n+\frac{1}{2}}$, are rewritten as T^* . Equation 26 now becomes

$$\begin{aligned}
& -FoT_{i-1,j,k}^* + (1 + 2Fo)T_{i,j,k}^* - FoT_{i,j,k}^* = T_{i,j+1,k}^n \\
& + 2FoR_1(T_{i,j+1,k}^n - T_{i,j,k}^n) + FoR_2(T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) \\
& + 2FoR_1\Delta y\frac{\alpha \epsilon}{k}(T_\infty^4 - T_{i,j,k}^{n4}) + 2FoR_1\Delta y\frac{\alpha C_{SA}}{k}\phi_s + 2FoR_1\Delta y\frac{\alpha F_A a}{k}\phi_s \quad (27) \\
& + 2FoR_1\Delta y\frac{F_E \epsilon}{k}\phi_E + 2FoR_1\Delta y\frac{q''}{k} + 2FoBiR_1^{\frac{1}{2}}(T_\infty - T_{i,j,k}^n)
\end{aligned}$$

The derivation for the y-direction nodal temperature equation is similar to the x-direction derivation. The y-direction equation for the same node is

$$\begin{aligned}
& (1 + 2FoR_1)T_{i,j,k}^{n+\frac{1}{2}} - 2FoR_1T_{i,j+1,k}^{n+\frac{1}{2}} = T_{i,j,k}^n \\
& + Fo(T_{i-1,j,k}^* + T_{i+1,j,k}^* - 2T_{i,j,k}^*) + FoR_2(T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) \\
& + 2FoR_1\Delta y \frac{\sigma\epsilon}{k}(T_{-}^4 - T_{i,j,k}^{n^4}) + 2FoR_1\Delta y \frac{\alpha C_{SA}}{k}\phi_s \\
& + 2FoR_1\Delta y \frac{\alpha F_A a}{k}\phi_s + 2FoR_1\Delta y \frac{F_E \epsilon}{k}\phi_E \\
& + 2FoR_1\Delta y \frac{q''}{k} + 2FoBi R_1^{\frac{1}{2}}(T_{-} - T_{i,j,k}^n)
\end{aligned} \tag{28}$$

The y-direction temperatures at time level $n + \frac{1}{2}$, $T^{n+\frac{1}{2}}$, are rewritten as T^{**} . Equation 28 now becomes

$$\begin{aligned}
& (1 + 2FoR_1)T_{i,j,k}^{**} - 2FoR_1T_{i,j+1,k}^{**} = T_{i,j,k}^n + Fo(T_{i-1,j,k}^* + T_{i+1,j,k}^* - 2T_{i,j,k}^*) \\
& + FoR_2(T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) + 2FoR_1\Delta y \frac{\sigma\epsilon}{k}(T_{-}^4 - T_{i,j,k}^{n^4}) \\
& + 2FoR_1\Delta y \frac{\alpha C_{SA}}{k}\phi_s + 2FoR_1\Delta y \frac{\alpha F_A a}{k}\phi_s + 2FoR_1\Delta y \frac{F_E \epsilon}{k}\phi_E \\
& + 2FoR_1\Delta y \frac{q''}{k} + 2FoBi R_1^{\frac{1}{2}}(T_{-} - T_{i,j,k}^n)
\end{aligned} \tag{29}$$

The expression for the z-direction temperatures at time level $n+1$ is dependent on the x-direction and y-direction temperatures at time level $n + \frac{1}{2}$, T^* and T^{**} , respectively. The z-direction nodal temperature equation is

$$\begin{aligned}
& -FoR_2 T_{i,j,k-1}^{n+1} + (1 + 2FoR_2) T_{i,j,k}^{n+1} - FoR_2 T_{i,j,k}^{n+1} = \\
& T_{i,j,k}^{**} + Fo(T_{i-1,j,k}^* + T_{i+1,j,k}^* - 2T_{i,j,k}^*) + 2FoR_1(T_{i,j+1,k}^{**} - T_{i,j,k}^{**}) \\
& + 2FoR_1 \Delta y \frac{\alpha}{k} (T_{i,j,k}^4 - T_{i,j,k}^{**}) + 2FoR_1 \Delta y \frac{\alpha C_{SA}}{k} \phi_s \\
& + 2FoR_1 \Delta y \frac{\alpha F_A a}{k} \phi_s + 2FoR_1 \Delta y \frac{F_E \epsilon}{k} \phi_E \\
& + 2FoR_1 \Delta y \frac{q''}{k} + 2FoBiR_1^{\frac{1}{2}} (T_{i,j,k}^4 - T_{i,j,k}^{**})
\end{aligned} \tag{30}$$

In a similar manner, the temperature equations for each node are derived. We note that during traverse along each coordinate direction in equations 26, 28, and 30, a tridiagonal matrix results for the solution of temperature.

2. Solution of the Nodal Temperature Equations

The x-direction nodal temperature equations for the rectangular block are of the form

$$A_{i,j,k} T_{i-1,j,k}^* + B_{i,j,k} T_{i,j,k}^* + C_{i,j,k} T_{i+1,j,k}^* = D_{i,j,k} \tag{31}$$

where the coefficients $A_{i,j,k}$, ..., $D_{i,j,k}$ are known from the previous time step.

Each row of T^* equations parallel to the x-axis is a tridiagonal matrix of coefficients $A_{i,j,k}$, $B_{i,j,k}$, and $C_{i,j,k}$. It was solved using the standard Tridiagonal Matrix Algorithm (TDMA) [Ref. 5]. After each row of T^* equations is solved, the y-direction equations will be solved [Ref. 3]. These are of the type

$$A_{2_{i,j,k}} T_{i,j-1,k}^{**} + B_{2_{i,j,k}} T_{i,j,k}^{**} + C_{2_{i,j,k}} T_{i,j+1,k}^{**} = D_{2_{i,j,k}} \quad (32)$$

As in the x-direction case, each row of T^{**} equations parallel to the y-axis is solved using a tridiagonal matrix solver. The z-direction equations are of the form

$$A_{3_{i,j,k}} T_{i,j,k-1}^{n+1} + B_{3_{i,j,k}} T_{i,j,k}^{n+1} + C_{3_{i,j,k}} T_{i,j,k+1}^{n+1} = D_{3_{i,j,k}} \quad (33)$$

The solution of the T^{n+1} equations is accomplished in a similar manner as used for both the x- and y-directions [Ref. 3].

3. Numerical Calculations

A computer program (program (BRIAN)) was written to evaluate the transient temperature distribution within the block using the Brian technique outlined in the previous sections. Figure 3 is a flow chart description of the program. A complete listing of program BRIAN is provided in Appendix D.

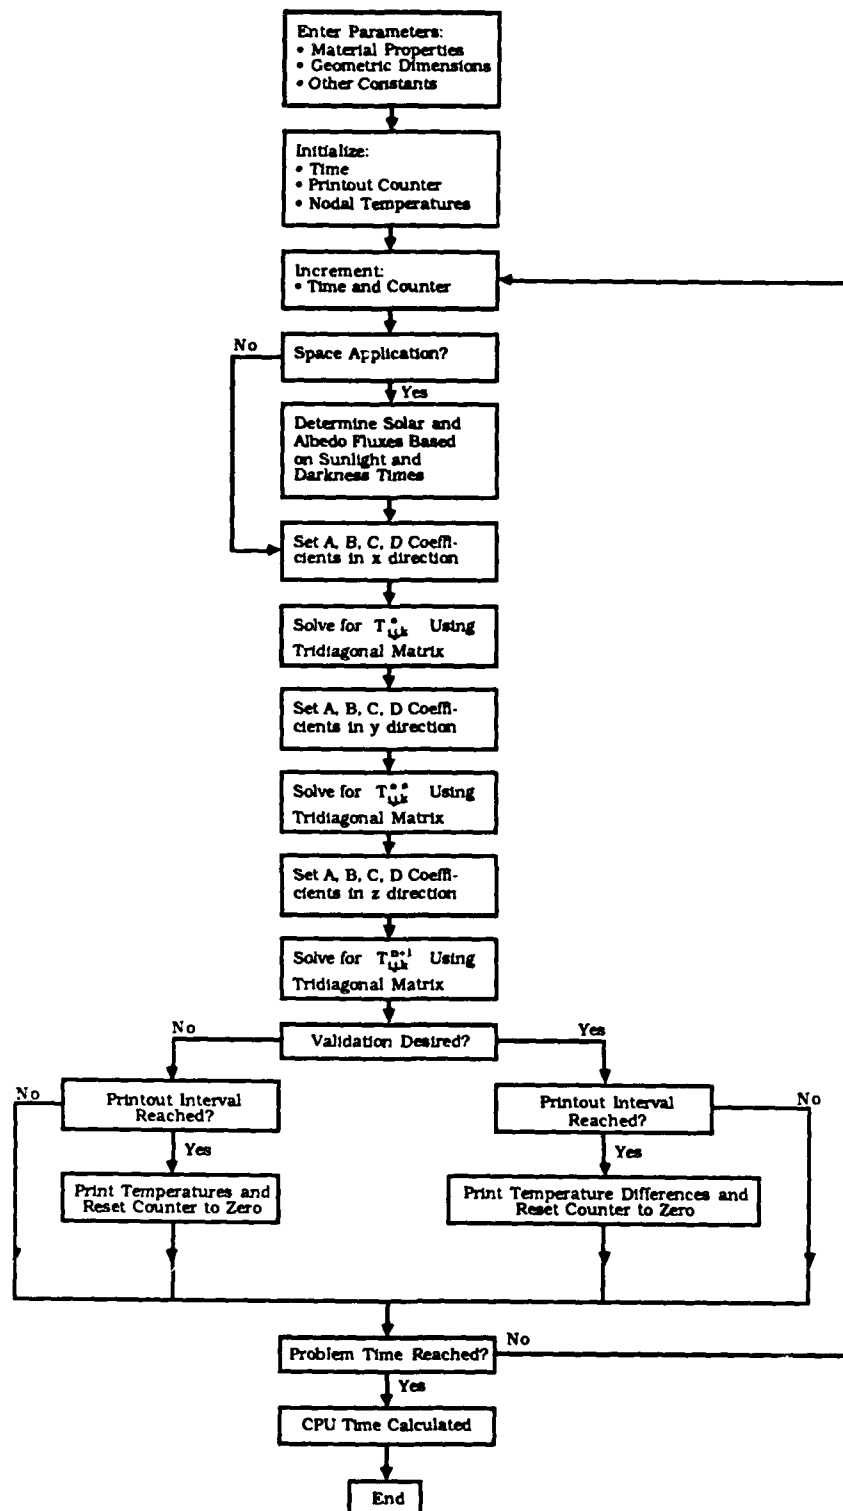

Figure 3. Flow Chart for Program BRIAN

III. VALIDATION

A. SELECTED GEOMETRY AND CONDITIONS

Both the Brian's technique and explicit technique programs required validation to ensure accuracy in the temperature solutions. Identical geometric and boundary conditions were used for these techniques in the validations. The left face had a constant surface heat flux with all other surfaces treated as adiabatic. Figure 4 shows the geometric and boundary conditions for the validation model. Table 1 lists the parameters used in the validation runs.

The Brian's technique and explicit technique programs were written to allow the user to conduct a validation test. The test involved taking the temperature differences at identical nodes in each program and then comparing each node's temperature difference on a graph.

The finite difference solutions for the rectangular block were also compared with an analytical solution for a semi-infinite solid exposed to a uniform flux at its surface. The closed-form solution would be a reasonable approximation to the actual solution for small times when interior nodes are not influenced by the lateral boundary surfaces of the rectangular block [Ref. 2].

Incropera and DeWitt [Ref. 2] tabulated the closed-form solution for the case of constant surface heat flux in terms of complementary error functions. These were evaluated in the present study based on

Figure 4. Rectangular Model Showing Boundary Conditions Used in Validation Runs

TABLE 1
PARAMETERS USED IN VALIDATION RUNS

Left face flux	1,500 W/m ²
Other faces	0 W/m ² (adiabatic)
Material density	2,770 kg/m ³
Thermal conductivity	177 W/m-K
Specific Heat	875 J/kg-K
Initial Temperature	275K
Ambient Temperature	295 K
Distances from face	1.0, 0.4, 0.0 m

the polynomial approximations provided by Abramowitz and Stegun [Ref. 5].

B. NUMERICAL COMPUTATIONS

A computer program was written to evaluate the closed-form solution for a semi-infinite solid with a constant surface heat flux. The fifth-order polynomial approximations to the complementary error function have an error less than 1.5×10^{-7} [Ref. 5].

Figure 5 is a flow-chart description of the closed-form solution program VALID. The parameters entered are identical to those used in programs EXPLICIT and BRIAN. A complete listing of program VALID is provided in Appendix E. Table 1 lists the parameters used for the validation runs.

The validation period for programs VALID, EXPLICIT, and BRIAN was 3,600 seconds (one hour). The distance inside the semi-infinite solid was based on pre-selected nodes in the rectangular model. Three distances were used in the semi-infinite solid, corresponding to three selected nodes in the rectangular block.

In the first validation run, each coordinate direction had 11 nodes. This corresponded to an explicit technique time increment of 17.117 seconds, which was also selected as the time increment for programs BRIAN and VALID. In the second validation run, the number of nodes was increased to 21 in each coordinate direction. The time increment used in this run was 4.279 seconds. A third validation run was conducted using 11 nodes in each coordinate direction. The explicit technique and program VALID used a time increment of 17.117 seconds. The time increment for program BRIAN was

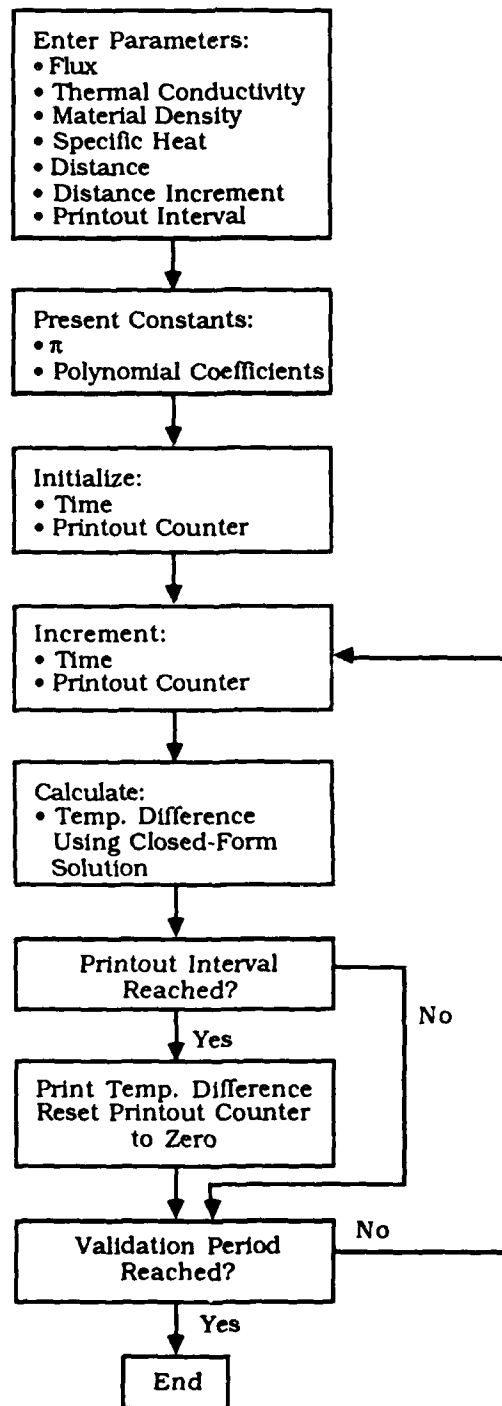

Figure 5. Flow Chart for Program VALID

increased to 120 seconds. The increased time increment was used to determine whether the program BRIAN temperature differences would differ significantly from those previously obtained with the 17.117-second time increment.

C. VALIDATION COMPUTATIONS

Graphical representations of the temperature differences experienced over the validation period are presented in Figures 6 through 14.

At a distance of one meter into the block (Figures 6 and 7), the temperature differences calculated in EXPLICIT and BRIAN diverge significantly from VALID after a period of 616 seconds. This is to be expected as the effects of the constant surface heat flux will provide higher temperatures in the rectangular block than in the semi-infinite solid. The rectangular block can thus be modeled as a semi-infinite solid for only about 10 minutes at a distance of one meter.

At a distance of 0.4 meters into the solid and on the surface (Figures 8 through 11), both EXPLICIT AND BRIAN temperature differences were in close agreement with the closed-form temperature differences for almost the entire validation period of one hour.

Increasing the number of nodes and, consequently, decreasing the time increment had virtually no effect on temperature differences, as can be seen in Figures 6 through 11.

Increasing the program BRIAN time increment to 120 seconds did not degrade the accuracy of the solution. In the three cases

Figure 6. Temperature Difference Versus Time for Time Increment of 17.117 Seconds with Distance of 1 Meter Into Block

Figure 7. Temperature Difference Versus Time for Time Increment of 4.279 Seconds with Distance of 1 Meter Into Block

Figure 8. Temperature Difference Versus Time for Time Increment of 17.117 Seconds with Distance of 0.4 Meters Into Block

Figure 9. Temperature Difference Versus Time for Time Increment of 4.279 Seconds with Distance of 0.4 Meters Into Block

Figure 10. Temperature Difference Versus Time for Time Increment of 17.117 Seconds on Left Surface of Block

Figure 11. Temperature Difference Versus Time for Time Increment of 4.279 Seconds on Left Surface of Block

Figure 12. Temperature Difference Versus Time for Time Increments of 17.117 and 120 Seconds with Distance of 1 Meter Into Block

Figure 13. Temperature Difference Versus Time for Time Increments of 17.117 and 120 Seconds with Distance of 0.4 Meters Into Block

Figure 14. Temperature Difference Versus Time for Time Increments of 17.117 and 120 Seconds on Left Surface of Block

involving distances of 1.0 and 0.4 meters into the surface and on the surface, the temperature differences did not vary by more than 0.045 percent from those obtained using a 17.117-second time increment. Figures 12 through 14 show the 120-second time increment plot of temperature difference versus time being in close agreement to the corresponding 17.117-second time increment plots.

Using a time increment of 17.117 seconds, the maximum error was found to be within 0.019 percent for an 11 x 11 x 11 grid. The maximum error was calculated using

$$\% \text{ ERROR} = \frac{T_{\text{COMPUTED}} - T_{\text{EXACT}}}{T_{\text{EXACT}}} \times 100\% \quad (34)$$

where T_{COMPUTED} is the Brian's technique computed temperature and T_{EXACT} is the closed-form temperature. Sampling points were taken at 600-second intervals.

In a similar manner, the maximum error was calculated for a time increment of 4.279 seconds. The maximum error was found to be 0.021 percent for a 21 x 21 x 21 grid.

A time increment of 120 seconds was above the maximum allowable time step from stability considerations for the explicit technique. Brian's technique thus allowed time steps above the limitation of the explicit technique with very little compromise in solution accuracy.

Based on the validation test results, program BRIAN can be considered correct and validated for further use.

IV. APPLICATIONS

A. GENERAL

The Brian technique was used to solve for the temperature distribution in an application example. The example involves the transient thermal response of a component on board an orbiting satellite.

B. ORBITING SATELLITE COMPONENT

1. Geometry and Initial Conditions

The transient thermal response of an orbiting spacecraft component will be investigated. The spacecraft component is in a non-geosynchronous circular orbit at an altitude of 1,609.364 kilometers (1,000 miles). The equation for the orbital period is listed in Agrawal [Ref. 7] as

$$P = 2\pi \sqrt{\frac{d^3}{\mu}} \quad (35)$$

where μ is the gravitational constant of the earth and d is the sum of the satellite altitude and radius of the earth. Eisele and Nichols [Ref. 8] list the values of μ and earth radius as $398,603.2 \text{ km}^2/\text{s}^2$ and 6,378.165 kilometers, respectively.

The period of revolution in this case is 7,104.4 seconds or 118.40 minutes. For a satellite in a circular orbit at an altitude of 100 miles, Stevenson and Grafton [Ref. 9] listed the sun exposure time as 72 percent of the orbital time. During one revolution around the earth,

the satellite will have 85.25 minutes of sun exposure and spend 33.15 minutes in the earth's shadow. For the example application, the satellite is assumed to start the orbital period at the instant it becomes exposed to the sun.

Single spin stabilization is assumed, thus allowing the spacecraft component to spin about a principal moment of inertia axis [Ref. 7]. The spacecraft component spins about the z-axis, as depicted in Figure 15. With single spin stabilization, it is assumed that the component analyzed here will have all four sides continuously exposed to the sun with the top and bottom surfaces not receiving solar flux. The fraction of solar flux that is incident on the satellite surface is usually defined as the solar aspect coefficient [Ref. 7]. Thus, for this example, the solar aspect coefficients are assumed to be 1.0 for the side surfaces and 0.0 for the top and bottom surfaces.

Stevenson and Grafton [Ref. 9] compiled the geometric factors for both earth radiation and reflected solar radiation (albedo) on a flat plate. The geometric factor for earth radiation depends on the satellite's altitude and the altitude angle between the normal to the rectangular component and the vertical to the satellite from the earth [Ref. 9]. Figure 16 depicts the geometry involved. The geometric factor for a rectangular plate at an altitude of 1,000 miles (1,609.364 kilometers) and altitude angle of 60 degrees is listed as 0.3174 [Ref. 9].

Figure 15. Component on a Satellite in Circular Orbit

Figure 16. Geometry Used in Determining Geometric Factor for Earth Thermal Radiation

The geometric factor for reflected solar radiation is dependent on the satellite's altitude, the altitude angle, the sun angle, and the angle of axis rotation [Ref. 7]. Figure 17 depicts the geometry involved. The geometric factor is 0.0456 for a satellite at 1,000 miles altitude, altitude angle of 60 degrees, sun angle of 90 degrees, and rotation angle of 0 degrees [Ref. 9].

Figure 17. Geometry Used in Determining Geometric Factor for Solar Reflected Radiation

TABLE 2
PARAMETERS USED IN ORBITING SATELLITE APPLICATION

Dimensions	0.15 m x 0.10 m x 0.015 m
Material	aluminum alloy 2024-T6
• density	2,770 kg/m ³
• thermal conductivity	186 W/m-K
• specific heat	1,000 J/kg-K
Exterior Coating	black paint
• solar absorptivity	0.97
• emissivity	0.92
Imposed Flux	
• bottom surface	50,000 W/m ²
Orbital Data	
• altitude	1,609.364 km (1,000 mi)
• period of rotation	118.40 min
• exposure to sun	85.25 min
• exposure to darkness	33.15 min
Solar Aspect Coefficients	
• side surfaces	1.0
• top and bottom surfaces	0.0
External Flux	
• solar flux	1,353 W/m ²
• earth radiation	237 W/m ²
• albedo coefficient	0.3
Geometric Factors	
• earth radiation	0.3174
• albedo flux	0.0456
Initial Data	
• heat transfer coefficients	0.0 W/m ² -K
• ambient temperature	0 K
• initial nodal temperature	500 K

Agrawal [Ref. 7] listed the mean annual solar flux, mean annual earth radiation, and mean annual value of albedo coefficient as 1,353 W/m², 237 W/m², and 0.30, respectively. These value are used in the example.

The material coating on the component's exterior determines the solar absorptivity and emissivity. The component is assumed to be coated with black paint, thus providing a solar absorptivity of 0.97 and an emissivity of 0.92 [Ref. 10].

The component is rectangular with dimensions of 0.25 m x 0.10 m x 0.015 m and is made of aluminum alloy 2024-T6. Incropeia and DeWitt [Ref. 2] list the values for density, thermal conductivity, and specific heat.

The component is mounted on the exterior of the satellite. The bottom surface is attached to the satellite with all other surfaces exposed to the space environment. The flux on the bottom surface is assumed to be 50,000 W/m².

Table 2 lists the properties and other parameters used in the example.

2. Numerical Calculations

A time increment of 120 seconds (2 minutes) was used in program BRIAN. The program covered a period of 120,000 seconds (33.33 hours), during which the spacecraft component conducted 16.9 orbits. The temperatures of top surface node were plotted versus time, as shown in Figures 18 and 19. The temperature versus time

Figure 18. Temperature Variation of the Top Surface Center Node

Figure 19. Temperature Variation of the Top Surface Center Node

plots in both figures demonstrate an imperfect sinusoid. Steady periodic response occurs following orbit. The peak temperatures during the third orbit vary from the second orbit peak temperatures by 0.27 percent. The largest temperature difference in successive peak temperatures is 0.27 percent and occurs between the second and third orbits.

The oscillations in temperature distribution may be attributed to overlaps in the sunlight and eclipse periods. The sunlight exposure time for the orbit is 85.25 minutes. A time increment of 120 seconds (2 minutes) would allow solar flux to be seen by the satellite component for an additional 1.25 minutes on the first orbit. Thus, 1.25 minutes of the first eclipse period would be missed at the beginning of the eclipse period. At the end of the eclipse period, the component is in darkness an extra 1.60 minutes. These overlaps occur throughout the running of the program with the maximum overlap being 2 minutes.

V. RESULTS

Brian's technique was validated for four of the six rectangular surfaces. For cases involving flux or convective boundary conditions on the front and back surfaces of the model, temperature distributions did not follow the pattern obtained in previous validation cases. This anomaly requires further investigation.

VI. CONCLUSIONS

Brian's technique was validated using the explicit technique and the closed form solution for a semi-infinite solid. For the same time increment, the explicit technique uses six times less CPU time. However, as the time increment was increased, the CPU time used in Brian's technique became less than that used in the explicit technique for time steps larger than 110 seconds. Brian's technique used time increments that would lead to instability if used in the explicit technique.

VII. RECOMMENDATIONS

While developing the computer code for Brian's technique, material properties were assumed to be independent of temperature. A more precise code would make thermal conductivity a function of temperature.

Another improvement for the computer code when used for spacecraft thermal analysis computations involves the application of orbital mechanics. This would permit the use of non-circular orbits in the code.

This study was restricted to the use of Cartesian coordinates in Brian's technique. Further study is required in applying Brian's technique in cylindrical and spherical coordinates.

APPENDIX A
EXPLICIT TECHNIQUE NODE EQUATIONS

A. INTERIOR NODE EQUATION

$$\begin{aligned} T_{i,j,k}^{n+1} = & T_{i,j,k}^n + Fo(T_{i-1,j,k}^n + T_{i+1,j,k}^n - 2T_{i,j,k}^n) \\ & + R_1 Fo(T_{i,j-1,k}^n + T_{i,j+1,k}^n - 2T_{i,j,k}^n) \\ & + R_2 Fo(T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) \end{aligned}$$

B. SURFACE NODE EQUATIONS

1. Left Face

$$\begin{aligned} T_{i,j,k}^{n+1} = & T_{i,j,k}^n + Fo(T_{i-1,j,k}^n + T_{i+1,j,k}^n - 2T_{i,j,k}^n) \\ & + 2FoR_1(T_{i,j+1,k}^n - T_{i,j,k}^n) \\ & + FoR_2(T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) \\ & + 2Foq''R_1^{\frac{1}{2}}(T_{\infty} - T_{i,j,k}^n) \end{aligned}$$

2. Right Face

$$\begin{aligned} T_{i,j,k}^{n+1} = & T_{i,j,k}^n + Fo(T_{i-1,j,k}^n + T_{i+1,j,k}^n - 2T_{i,j,k}^n) \\ & + 2FoR_1(T_{i,j-1,k}^n - T_{i,j,k}^n) \\ & + FoR_2(T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) \end{aligned}$$

Figure 29. Geometry of Rectangular Model

3. Bottom Face

$$\begin{aligned}
 T_{i,j,k}^{n+1} = & T_{i,j,k}^n + Fo(T_{i-1,j,k}^n + T_{i+1,j,k}^n - 2T_{i,j,k}^n) \\
 & + FoR_1(T_{i,j-1,k}^n + T_{i,j+1,k}^n - 2T_{i,j,k}^n) \\
 & + 2FoR_2(T_{i,j,k+1}^n - T_{i,j,k}^n)
 \end{aligned}$$

4. Top Face

$$\begin{aligned}
 T_{i,j,k}^{n+1} = & T_{i,j,k}^n + Fo(T_{i-1,j,k}^n + T_{i+1,j,k}^n - 2T_{i,j,k}^n) \\
 & + FoR_1(T_{i,j-1,k}^n + T_{i,j+1,k}^n - 2T_{i,j,k}^n) \\
 & + 2FoR_2(T_{i,j,k-1}^n - T_{i,j,k}^n)
 \end{aligned}$$

5. Front Face

$$\begin{aligned} T_{i,j,k}^{n+1} &= T_{i,j,k}^n + 2Fo(T_{i-1,j,k}^n - T_{i,j,k}^n) \\ &\quad + FoR_1(T_{i,j-1,k}^n + T_{i,j+1,k}^n - 2T_{i,j,k}^n) \\ &\quad + FoR_2(T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) \end{aligned}$$

6. Back Face

$$\begin{aligned} T_{i,j,k}^{n+1} &= T_{i,j,k}^n + 2Fo(T_{i+1,j,k}^n - T_{i,j,k}^n) \\ &\quad + FoR_1(T_{i,j-1,k}^n + T_{i,j+1,k}^n - 2T_{i,j,k}^n) \\ &\quad + FoR_2(T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) \end{aligned}$$

C. PERIMETER NODE EQUATIONS

1. Perimeter 1

$$\begin{aligned} T_{i,j,k}^{n+1} &= T_{i,j,k}^n + 2Fo(T_{i+1,j,k}^n - T_{i,j,k}^n) \\ &\quad + FoR_1(T_{i,j-1,k}^n + T_{i,j+1,k}^n - 2T_{i,j,k}^n) \\ &\quad + 2FoR_2(T_{i,j,k-1}^n - T_{i,j,k}^n) \end{aligned}$$

2. Perimeter 2

$$\begin{aligned}T_{i,j,k}^{n+1} &= T_{i,j,k}^n + 2Fo(T_{i-1,j,k}^n - T_{i,j,k}^n) \\&+ FoR_1(T_{i,j-1,k}^n + T_{i,j+1,k}^n - 2T_{i,j,k}^n) \\&+ 2FoR_2(T_{i,j,k-1}^n - T_{i,j,k}^n)\end{aligned}$$

3. Perimeter 3

$$\begin{aligned}T_{i,j,k}^{n+1} &= T_{i,j,k}^n + 2Fo(T_{i+1,j,k}^n - T_{i,j,k}^n) \\&+ FoR_1(T_{i,j-1,k}^n + T_{i,j+1,k}^n - 2T_{i,j,k}^n) \\&+ 2FoR_2(T_{i,j,k+1}^n - T_{i,j,k}^n)\end{aligned}$$

4. Perimeter 4

$$\begin{aligned}T_{i,j,k}^{n+1} &= T_{i,j,k}^n + 2Fo(T_{i-1,j,k}^n - T_{i,j,k}^n) \\&+ FoR_1(T_{i,j-1,k}^n + T_{i,j+1,k}^n - 2T_{i,j,k}^n) \\&+ 2FoR_2(T_{i,j,k+1}^n - T_{i,j,k}^n)\end{aligned}$$

5. Perimeter 5

$$\begin{aligned}T_{i,j,k}^{n+1} &= T_{i,j,k}^n + 2Fo(T_{i-1,j,k}^n - T_{i,j,k}^n) \\&+ 2FoR_1(T_{i,j-1,k}^n - T_{i,j,k}^n) \\&+ FoR_2(T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n)\end{aligned}$$

6. Perimeter 6

$$\begin{aligned} T_{i,j,k}^{n+1} = & T_{i,j,k}^n + 2Fo(T_{i+1,j,k}^n - T_{i,j,k}^n) \\ & + 2FoR_1(T_{i,j+1,k}^n - T_{i,j,k}^n) \\ & + FoR_2(T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) \end{aligned}$$

7. Perimeter 7

$$\begin{aligned} T_{i,j,k}^{n+1} = & T_{i,j,k}^n + 2Fo(T_{i-1,j,k}^n - T_{i,j,k}^n) \\ & + 2FoR_1(T_{i,j+1,k}^n - T_{i,j,k}^n) \\ & + FoR_2(T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) \\ & + 2FoBiR_1^{\frac{1}{2}}(T_{\infty} - T_{i,j,k}^n) + 2Foq''R_1 \frac{\Delta y}{k} \end{aligned}$$

8. Perimeter 8

$$\begin{aligned} T_{i,j,k}^{n+1} = & T_{i,j,k}^n + 2Fo(T_{i+1,j,k}^n - T_{i,j,k}^n) \\ & + 2FoR_1(T_{i,j+1,k}^n - T_{i,j,k}^n) \\ & + FoR_2(T_{i,j,k-1}^n + T_{i,j,k+1}^n - 2T_{i,j,k}^n) \\ & + 2FoBiR_1^{\frac{1}{2}}(T_{\infty} - T_{i,j,k}^n) + 2Foq''R_1 \frac{\Delta y}{k} \end{aligned}$$

9. Perimeter 9

$$\begin{aligned} T_{i,j,k}^{n+1} &= T_{i,j,k}^n + Fo(T_{i-1,j,k}^n + T_{i+1,j,k}^n - 2T_{i,j,k}^n) \\ &\quad + 2FoR_1(T_{i,j-1,k}^n - T_{i,j,k}^n) \\ &\quad + 2FoR_2(T_{i,j,k+1}^n - T_{i,j,k}^n) \end{aligned}$$

10. Perimeter 10

$$\begin{aligned} T_{i,j,k}^{n+1} &= T_{i,j,k}^n + Fo(T_{i-1,j,k}^n + T_{i+1,j,k}^n - 2T_{i,j,k}^n) \\ &\quad + 2FoR_1(T_{i,j-1,k}^n - T_{i,j,k}^n) \\ &\quad + 2FoR_2(T_{i,j,k-1}^n - T_{i,j,k}^n) \end{aligned}$$

11. Perimeter 11

$$\begin{aligned} T_{i,j,k}^{n+1} &= T_{i,j,k}^n + Fo(T_{i-1,j,k}^n + T_{i+1,j,k}^n - 2T_{i,j,k}^n) \\ &\quad + 2FoR_1(T_{i,j+1,k}^n - T_{i,j,k}^n) \\ &\quad + 2FoR_2(T_{i,j,k-1}^n - T_{i,j,k}^n) \\ &\quad + 2FoBiR_1^{\frac{1}{2}}(T_{\infty} - T_{i,j,k}^n) + 2Foq''R_1 \frac{\Delta y}{k} \end{aligned}$$

12. Perimeter 12

$$\begin{aligned}
 T_{i,j,k}^{n+1} = & T_{i,j,k}^n + Fo(T_{i-1,j,k}^n + T_{i+1,j,k}^n - 2T_{i,j,k}^n) \\
 & + 2FoR_1(T_{i,j+1,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_2(T_{i,j,k+1}^n - T_{i,j,k}^n) \\
 & + 2FoBiR_1^{\frac{1}{2}}(T_{\infty} - T_{i,j,k}^n) + 2Foq''R_1 \frac{\Delta y}{k}
 \end{aligned}$$

D. CORNER NODE EQUATIONS

1. Corner 1

$$\begin{aligned}
 T_{i,j,k}^{n+1} = & T_{i,j,k}^n + 2Fo(T_{i+1,j,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_1(T_{i,j+1,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_2(T_{i,j,k+1}^n - T_{i,j,k}^n) \\
 & + 2Foq''R_1 \frac{\Delta y}{k}
 \end{aligned}$$

2. Corner 2

$$\begin{aligned}
 T_{i,j,k}^{n+1} = & T_{i,j,k}^n + 2Fo(T_{i-1,j,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_1(T_{i,j+1,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_2(T_{i,j,k+1}^n - T_{i,j,k}^n) \\
 & + 2Foq''R_1 \frac{\Delta y}{k}
 \end{aligned}$$

3. Corner 3

$$\begin{aligned}
 T_{i,j,k}^{n+1} = & T_{i,j,k}^n + 2Fo(T_{i+1,j,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_1(T_{i,j+1,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_2(T_{i,j,k-1}^n - T_{i,j,k}^n) \\
 & + 2Foq''R_1 \frac{\Delta y}{k}
 \end{aligned}$$

4. Corner 4

$$\begin{aligned}
 T_{i,j,k}^{n+1} = & T_{i,j,k}^n + 2Fo(T_{i-1,j,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_1(T_{i,j+1,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_2(T_{i,j,k-1}^n - T_{i,j,k}^n) \\
 & + 2Foq''R_1 \frac{\Delta y}{k}
 \end{aligned}$$

5. Corner 5

$$\begin{aligned}
 T_{i,j,k}^{n+1} = & T_{i,j,k}^n + 2Fo(T_{i+1,j,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_1(T_{i,j-1,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_2(T_{i,j,k+1}^n - T_{i,j,k}^n) \\
 & + 2FoBiR_1^{\frac{1}{2}}(T_{\infty} - T_{i,j,k}^n)
 \end{aligned}$$

6. Corner 6

$$\begin{aligned}
 T_{i,j,k}^{n+1} = & T_{i,j,k}^n + 2Fo(T_{i-1,j,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_1(T_{i,j-1,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_2(T_{i,j,k+1}^n - T_{i,j,k}^n) \\
 & + 2FoBiR_1^{\frac{1}{2}}(T_{\infty} - T_{i,j,k}^n)
 \end{aligned}$$

7. Corner 7

$$\begin{aligned}
 T_{i,j,k}^{n+1} = & T_{i,j,k}^n + 2Fo(T_{i+1,j,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_1(T_{i,j-1,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_2(T_{i,j,k-1}^n - T_{i,j,k}^n) \\
 & + 2FoBiR_1^{\frac{1}{2}}(T_{\infty} - T_{i,j,k}^n)
 \end{aligned}$$

8. Corner 8

$$\begin{aligned}
 T_{i,j,k}^{n+1} = & T_{i,j,k}^n + 2Fo(T_{i-1,j,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_1(T_{i,j-1,k}^n - T_{i,j,k}^n) \\
 & + 2FoR_2(T_{i,j,k-1}^n - T_{i,j,k}^n) \\
 & + 2FoBiR_1^{\frac{1}{2}}(T_{\infty} - T_{i,j,k}^n)
 \end{aligned}$$

APPENDIX B

BRIAN'S TECHNIQUE NODE EQUATIONS

A. X-DIRECTION EQUATIONS

1. Corner 1

$$\begin{aligned}
 (1 + 2Fo)T_{i,j,k}^* - 2FoT_{i,j,k}^* &= T_{i,j,k}^n + U_3(T_{i,j+1,k}^n - T_{i,j,k}^n) \\

APPENDIX C
PROGRAM EXPLICIT

*

* PROGRAM EXPLICIT

*

*

* EXPLICIT METHOD FOR TRANSIENT HEAT CONDUCTION IN THREE
* DIMENSIONAL CARTESIAN COORDINATES

*

*

* DESCRIPTION OF VARIABLES USED IN PROGRAM EXPLICIT

*

* NOTE: SI UNITS ARE USED IN THIS PROGRAM UNLESS
* OTHERWISE NOTED

*

* 1. USER SPECIFIED VARIABLES

*

* A. GEOMETRIC DIMENSIONS:

*

* DELX-DISTANCE INCREMENT IN THE X DIRECTION
* DELY-DISTANCE INCREMENT IN THE Y DIRECTION
* DELZ-DISTANCE INCREMENT IN THE Z DIRECTION

*

* I----X COORDINATE OF NODE
* J----Y COORDINATE OF NODE
* K----Z COORDINATE OF NODE

*

* LX---LENGTH OF MODEL IN THE X DIRECTION
* LY---LENGTH OF MODEL IN THE Y DIRECTION
* LZ---LENGTH OF MODEL IN THE Z DIRECTION
*

* M----NUMBER OF NODES IN THE X DIRECTION
* N----NUMBER OF NODES IN THE Y DIRECTION
* P----NUMBER OF NODES IN THE Z DIRECTION
*

* B. MATERIAL PROPERTIES:
*

* CP---SPECIFIC HEAT
* K1---THERMAL CONDUCTIVITY
* RHO--DENSITY
*

* C. INITIAL DATA:
*

* FLUX--SURFACE FLUX
* FREQ--NUMBER OF TIME STEPS BETWEEN SUCCESSIVE
* TEMPERATURE PRINTOUTS
* H----HEAT TRANSFER COEFFICIENT
* TAMB--AMBIENT TEMPERATURE
* TINIT-INITIAL TEMPERATURE OF ALL NODES
* VAL---LOGIC NUMBER TO DETERMINE IF VALIDATION
* TEST IS TO BE RUN
*

* 2. NON-USER VARIABLES
*

* A. GENERAL:
*

* BIO----BIOT NUMBER
* COUNT--COUNTER FOR DETERMINING THE NUMBER OF ELAPSED

```

*           TIME STEPS
*   DELT---TIME INCREMENT
*   FO-----FOURIER NUMBER
*   TIME---DURATION OF CALCULATIONS
*   TNEW---MATRIX OF TEMPERATURES AFTER TIME STEP DELT
*
*
*   B. EXTERNAL PROGRAMS:
*
*   CTIME-----USED IN EXTERNAL IMSL ROUTINE FOR DETERMINING
*               AMOUNT OF CPU TIME USED
*   NOUT-----USED IN EXTERNAL IMSL ROUTINE FOR DETERMINING
*               AMOUNT OF CPU TIME USED
*   TIME0-----CPU TIME AT BEGINNING OF CALCULATIONS
*   TIME1-----CPU TIME AT END OF CALCULATIONS
*   UMACH-----USED IN EXTERNAL IMSL ROUTINE FOR DETERMINING
*               AMOUNT OF CPU TIME USED
*
*

*****
*
* PROGRAM BRIAN
*
*****
*****
*
* BRIAN'S METHOD FOR TRANSIENT HEAT CONDUCTION IN THREE
* DIMENSIONAL CARTESIAN COORDINATES
*
*****
*****
*
* DESCRIPTION OF VARIABLES USED IN PROGRAM BRIAN
*
* NOTE: SI UNITS ARE USED IN THIS PROGRAM UNLESS
* OTHERWISE SPECIFIED
*
* 1. USER SPECIFIED VARIABLES
*
* A. GEOMETRIC DIMENSIONS:
*
* DELX-DISTANCE INCREMENT IN THE X DIRECTION
* DELY-DISTANCE INCREMENT IN THE Y DIRECTION
* DELZ-DISTANCE INCREMENT IN THE Z DIRECTION
*
* I----X COORDINATE OF NODE
* J----Y COORDINATE OF NODE
* K----Z COORDINATE OF NODE
*
```

* LX---LENGTH OF MODEL IN X DIRECTION
 * LY---LENGTH OF MODEL IN Y DIRECTION
 * LZ---LENGTH OF MODEL IN Z DIRECTION
 *
 * M----NUMBER OF NODES IN THE X DIRECTION
 * N----NUMBER OF NODES IN THE Y DIRECTION
 * P----NUMBER OF NODES IN THE Z DIRECTION
 *
 *

* B. MATERIAL PROPERTIES:
 *

* CP---SPECIFIC HEAT
 * K1---THERMAL CONDUCTIVITY
 * RHO--DENSITY
 *
 *

* C. INITIAL DATA:
 *

* SUBSCRIPTS HAVE THE FOLLOWING MEANING:

* 1-LEFT FACE
 * 2-RIGHT FACE
 * 3-BOTTOM FACE
 * 4-TOP FACE
 * 5-FRONT FACE
 * 6-BACK FACE
 *

* BIO1,2,3,4,5,6-----BIOT NUMBER
 * DELT-----TIME INCREMENT
 * EPS1,2,3,4,5,6-----EMISSIVITY
 * FLUX1,2,3,4,5,6----SURFACE FLUX
 * FREQ-----NUMBER OF TIME STEPS BETWEEN SUCCESSIVE
 * TEMPERATURE PRINTOUTS
 * GEN-----ENERGY GENERATION TERM
 * H1,2,3,4,5,6-----HEAT TRANSFER COEFFICIENT
 * SIG1,2,3,4,5,6-----STEFAN--BOLTZMANN CONSTANT (USE 0 IF NO

* RADIATION HEAT TRANSFER; USE 5.67E-8 IF
 * RADIATION HEAT TRANSFER PRESENT)
 * TAMBI,2,3,4,5,6----AMBIENT TEMPERATURE
 * TINIT-----INITIAL TEMPERATURE OF ALL NODES
 * VAL-----LOGIC NUMBER TO DETERMINE IF VALIDATION
 * TEST IS TO BE RUN

* D. ADDITIONAL VARIABLES FOR SATELLITE APPLICATIONS:

* ABS1,2,3,4,5,6----ABSORPTIVITY
 * ALBCO-----ALBEDO COEFFICIENT
 * ALT-----ALTITUDE OF SATELLITE IN KILOMETERS
 * EARTH-----EARTH FLUX (NOTE: THE ABSORPTIVITY FOR
 * EARTH FLUX HAS THE SAME VALUE AS THE
 * EMISSIVITY FOR RADIATION HEAT TRANSFER
 * SINCE BOTH ARE IN THE INFRA RED REGION)
 * ECLIPS-----PERIOD OF TIME IN MINUTES THE SATELLITE
 * IS IN THE SHADOW OF THE EARTH
 * FA-----GEOMETRIC FACTOR FOR ALBEDO FLUX
 * FE-----GEOMETRIC FACTOR FOR EARTH FLUX
 * SAC1,2,3,4,5,6----SOLAR ASPECT COEFFICIENTS
 * SOLAR-----SOLAR FLUX

* 2. NON-USER VARIABLES

* A. GENERAL:

* A,B,C,D-----COEFFICIENT VECTORS FOR SOLVING THE
 * TEMPERATURE EQUATIONS IN SUBROUTINE TRIDAG
 * BETA-----VECTOR OF INTERMEDIATE COEFFICIENTS SOLVED

* SUBROUTINE TRIDAG
 * BIOT1,2,3,4,5,6--BIOT NUMBER
 * COUNT-----COUNTER FOR DETERMINING THE NUMBER OF
 * ELAPSED TIME STEPS
 * FO-----FOURIER NUMBER
 * GAMMA-----VECTOR OF INTERMEDIATE COEFFICIENTS
 * SOLVE IN SUBROUTINE TRIDAG
 * IF,L-----NUMBERS CORRESPONDING TO THE FIRST AND LAST
 * EQUATIONS TO BE SOLVED IN SUBROUTINE TRIDAG
 * QDOT-----MATRIX OF NODES DEALING WITH ENERGY
 * GENERATION
 * T-----MATRIX OF TEMPERATURES AFTER HALF-TIME STEP
 * IN THE Z DIRECTION
 * TEMP-----TEMPORARY STORAGE VECTOR FOR TEMPERATURES
 * CALCULATED IN SUBROUTINE TRIDAG
 * TIME-----DURATION OF CALCULATIONS
 * TSTAR1-----MATRIX OF TEMPERATURES AFTER HALF-TIME STEP
 * IN THE X DIRECTION
 * TSTAR2-----MATRIX OF TEMPERATURES AFTER HALF-TIME STEP
 * IN THE Y DIRECTION
 *
 *
 *
 * B. ADDITIONAL VARIABLES FOR SATELLITE APPLICATIONS:
 *
 * ALBED1,2,3,4,5,6---ALBEDO FLUX RECEIVED ON A SURFACE
 * DIST-----SUM OF EARTH RADIUS AND SATELLITE ALTITUDE
 * EARTH1,2,3,4,5,6---EARTH FLUX RECEIVED ON A SURFACE
 * MU-----GRAVITATIONAL CONSTANT
 * PERIOD-----THE TIME FOR ONE SATELLITE ORBIT
 * RE-----RADIUS OF THE EARTH
 * SOLAR1,2,3,4,5,6---SOLAR FLUX RECEIVED ON A SURFACE
 * SUN-----THE TIME IN MINUTES THE SATELLITE RECEIVES
 * SUNLIGHT DURING ONE ORBIT
 *

```

*
* C. VARIABLES FROM EXTERNAL PROGRAMS:
*
* CTIME-----USED IN EXTERNAL IMSL ROUTINE FOR DETERMINING
*           AMOUNT OF CPU TIME USED
* NOUT-----USED IN EXTERNAL IMSL ROUTINE FOR DETERMINING
*           AMOUNT OF CPU TIME USED
* TIMEO-----CPU TIME AT BEGINNING OF CALCULATIONS
* TIMEI-----CPU TIME AT END OF CALCULATIONS
* UMACH-----USED IN EXTERNAL IMSL ROUTINE FOR DETERMINING
*           AMOUNT OF CPU TIME USED
*
*

APPENDIX E
PROGRAM VALID

PROGRAM VALID

*

* VALIDATION PROGRAM

*

* THE PURPOSE OF THIS PROGRAM IS TO VALIDATE THE
* TEMPERATURES OBTAINED BY THE EXPLICIT AND BRIAN
* PROGRAMS. CONDITIONS USED IN THE VALIDATION PROCESS
* ARE A CONSTANT SURFACE HEAT FLUX ON THE LEFT FACE
* AND ADIABATIC CONDITIONS ON ALL OTHER SURFACES.

*

*

* THIS PROGRAM PROVIDES THE CLOSED-FORM SOLUTION OF
* TRANSIENT HEAT CONDUCTION IN A SEMI-INFINITE SOLID.
* THE CLOSED-FORM SOLUTION FOR CONSTANT SURFACE HEAT
* FLUX IS FROM "INTRODUCTION TO HEAT TRANSFER" BY
* INCROPERA AND DEWITT. THE RATIONAL APPROXIMATION FOR
* THE ERROR FUNCTION IN THE CLOSED-FORM SOLUTION IS FROM
* "HANDBOOK OF MATHEMATICAL FUNCTIONS" EDITED BY
* ABRAMOWITZ AND STEGUN.

*

*
